

GGGI CTAF AI Secretariat Coding Intern

Take-Home Coding Assignment

Reference: *INT_CTL015_E1*

Background

CTAF (Climate Technology Accelerator Fund) receives climate technology project proposals from institutions across GGGI member countries. As part of this assignment, you will build a simple web tool that allows a project proposal to be entered through a structured form and stored for later review.

Task

Build a small web application that lets a user submit a climate technology project proposal through a web form, saves the submission, and displays previously submitted proposals in a list.

Requirements

1. Submission Form

The form should include the following fields:

- Project Name (text, required)
- Target Country (dropdown — at least 5 countries)
- Climate Technology Category (dropdown: Renewable Energy / Carbon Measurement (MRV) / Smart Grid / Climate Risk Mapping / Other)
- Estimated Budget in USD (number, required)
- Planned Start Date (date)
- Project Summary (multi-line text, max 300 characters)

2. Validation

- Block submission if a required field is empty, and show a clear error message
- Estimated Budget must be a positive number
- Project Summary must respect the character limit, with a live character counter

3. Storage & List View

- Save submitted data using any backend storage method (SQLite, a JSON file, an in-memory store, etc. — your choice)
- Display all submitted proposals in a table on a separate list page
- Add a filter on the list page by Country or by Technology Category

4. Basic CRUD

- Clicking an item in the list should open a detail view
- Include a delete function (with a confirmation prompt)
- Edit functionality is optional but welcomed

Tech Stack

Your choice. For example: React + Node/Express + SQLite, or plain HTML/CSS/JS + Python Flask. Use whatever stack you are most comfortable and fast with.

Time Budget

This assignment is scoped for roughly 3–4 hours of focused work, reflecting a realistic intern-level task.

On the Use of AI Tools

You are encouraged to use AI coding tools (Claude, ChatGPT, GitHub Copilot, Cursor, etc.) — this mirrors how the role will actually be performed. Free-tier versions of these tools are more than sufficient for a task of this size; no paid subscription is required.

Please include a short note (5–10 lines) describing:

- 2–3 key prompts you used during development
- Whether you used the AI's output as-is or modified it, and why

What to Submit

- A link to your code (GitHub repository, or a shared .zip file link)
- A README file with setup and run instructions
- A short screen recording (1–2 minutes, e.g. via Loom) showing the app running — this helps us verify functionality regardless of local environment differences
- Your AI-prompt usage note (see above)

Submission

Please submit all materials through the form link provided in your invitation email. The deadline is 72 hours from when you receive this assignment.

Evaluation Criteria

Criteria	Weight	What We Look For
Functionality	40%	Form submission → storage → list view flow works end-to-end; filtering and CRUD work as expected
Code Quality	25%	Clear separation of frontend/backend, validation logic, error handling
Use of AI Tools	20%	Quality of prompts, and judgment shown in reviewing/correcting AI-generated code
Documentation	15%	Clarity of README, code readability

Thank you for your interest in the CTAF AI Secretariat Coding Intern position. We look forward to reviewing your submission before the interview.
